

British Sugar's Energy Policy is designed to minimise our environmental impact and find opportunities to generate green energy for our own operational use and to export where possible. As an ABF Sugar company we are committed to a near-term emission reduction target in consultation with the Science Based Target initiative and we are certified to the ISO 50001 standard.

We understand the impact of climate change and are playing our part by:

- Reducing our energy usage through performance improvement projects.
- Reducing our greenhouse gas emissions in absolute terms, and per tonne of raw material processed and product manufactured.
- Ceasing burning coal for energy and animal feed drying.
- Using only green imported renewable electricity.
- Enhancing our energy performance through the continual improvement of the energy management system. We have in place a process of measuring and regularly reviewing energy performance against improvement targets.
- Always taking energy performance into account in the design, procurement and implementation of all capital investments, plant modifications, and operational changes.
- Fulfilling our compliance obligations in line with all appropriate legislation and other requirements relating to the activities of the Company.
- Meeting our commitments to ABF Sugar to play our part in achieving its **science-based emission reduction target**.

This policy statement is communicated to all of British Sugar's employees, contractors whose activities impact on energy, and to the public via our website.
